

Installation

Web Based Installation

Most PHP open source projects allow their installation via a simple web based series of forms the user needs to fill in.

In most cases you just need to upload the project zip file on your server, extract it and point your browser at the new created folder.

MySQL Database

Most PHP open source projects work with MySQL database.

Having that database already installed as part of the PHP environment ease the installation process.

In most cases, during the installation there is a need to set up a dedicated database for the new project and feels in its details (username, password etc).
